<u>CERTIFICATE</u>

This is to certify that the project work entitled "INSTAGRAM FAKE ID DETECTION" is done by Name-AMARNATH PANDA, SANCHITA SABAT, CHANDAN DANDIA Regd. No.-21UG010149, 21UG010568, 21UG010264 in partial fulfillment of the requirements for the 6th Semester Sessional Examination of Bachelor of Technology in Computer Science and Engineering during the academic year 2023-24. This work is submitted to the department as a part of evaluation of 6th Semester Minor Project-II.

Project Supervisor

Class Teacher

Project Coordinator, 3rd Year

HOD, CSE

ACKNOWLEDGEMENT

We express our sincere gratitude to Ms. Sandhyarani Biswal of Computer science and engineering for giving us an opportunity to accomplish the project. Without his/her active support and guidance, this project report has not been successfully completed.

We also thank to our class teacher Mr. Pritam Raul for his/her constant support during the execution of our project.

We also thank Mr.Bhavani Sankar Panda, Project Coordinator, Dr. Sachikant Dash, Head of the Department of Computer Science and Engineering, Prof. (Dr.) Kakita Murali Gopal, Dy. Dean, Computational Science, SOET for their consistent support, guidance and help.

We also thanks to our friends, family members and others for their unconditional support during the project execution.

Amarnath Panda(21UG010149) Sanchita Sabat (21UG010568) Chandan Dandia(21UG010264)

ABSTRACT

The popularity of social media continues to grow, and its dominance of the entire world has become one of the aspects of modern life that cannot be ignored. The rapid growth of social media has resulted in the emergence of ecosystem problems. Hate speech, fraud, fake news, and a slew of other issues are becoming un-stoppable. With over 1.7 billion fake accounts on social media, the losses have al-ready been significant, and removing these accounts will take a long time. Due to the growing number of Instagram users, the need for identifying fake accounts on social media, specifically in Instagram, is increasing.

This process takes a long time if done manually by humans, we can now use machine learning to identify fake accounts thanks to the rapid development of machine learning. We can detect fake accounts on Instagram using machine learning by implementing the combination of image detection and natural language processing.

Fake ID detection algorithms may occasionally flag legitimate accounts as fake, leading to account suspensions or other penalties for innocent users. This can result in frustration and inconvenience for affected individuals.

By integrating these and potentially other techniques, Instagram could develop a robust system for detecting fake IDs on its platform, helping to maintain the integrity and trustworthiness of its user base. However, it's important to note that any such system would need to balance effectiveness with user privacy and transparency concerns.

Chapter: 1 **INTRODUCTION**

1.1 Purpose:

The primary goal of this project is to combat the proliferation of fake Instagram accounts, which can lead to various forms of abuse, including identity theft, spreading misinformation, and manipulation of user interactions. By implementing a robust detection system, the aim is to enhance user trust and confidence in the platform. Mitigating the proliferation of fake Instagram accounts, which not only jeopardizes user privacy and security but also undermines the credibility of the platform as a whole. Enhancing user confidence and trust in the authenticity of interactions and content on Instagram, fostering a safer and more enjoyable user experience.

1.2 Project Scope:

This project encompasses a comprehensive analysis of user behaviour, profile attributes, and other relevant factors to develop algorithms capable of identifying suspicious accounts accurately. It also includes the implementation of features to strengthen user authentication and profile verification processes. Implementing a multi-layered approach to account verification and authentication, including identity verification measures, two-factor authentication, and real-time monitoring of account activity. Collaborating with Instagram's existing security and moderation systems to integrate the proposed solution seamlessly and augment the platform's overall security posture.

1.3 Product Features:

In addition to the core functionality of fake account detection, the system will offer features such as two-factor authentication, real-time monitoring of user activity, and customizable alert mechanisms to notify users of potential security threats. Employing machine learning algorithms to analyse user behaviour patterns, engagement metrics, and content interactions to identify suspicious activity indicative of fake accounts.

Chapter: 2 WORK DONE IN THE RELATED AREA

2. 1 Research Papers on Social Media Account Verification Methods:

- Extensive literature review encompassing a wide range of methodologies and techniques employed for verifying the authenticity of social media accounts.
- Analysis of the strengths and limitations of various verification methods, including email verification, phone number verification, and identity document verification.
- Exploration of emerging trends such as biometric authentication and blockchainbased identity verification systems.

2.2 Machine Learning Studies for Fraud Detection in Online Platforms:

- Investigation into the application of machine learning algorithms, including supervised, unsupervised, and semi-supervised learning techniques, for detecting fraudulent activities on online platforms.
- Evaluation of feature engineering approaches, anomaly detection algorithms, and ensemble learning methods for improving detection accuracy and reducing false positives.

2.3 Existing Tools and Software Solutions for Detecting Fake Accounts:

- Comparative analysis of existing tools and software solutions designed for detecting fake accounts on social media platforms, such as Instagram, Facebook, and Twitter.
- Examination of features, performance metrics, and user feedback to assess the effectiveness and usability of these tools in real-world scenarios.
- Identification of gaps and areas for improvement in existing solutions, informing the design and development of novel detection mechanisms.

2.4 Case Studies Illustrating the Impact of Fake Accounts on Social Media:

- In-depth examination of real-world case studies showcasing the detrimental effects of fake accounts on user trust, platform integrity, and societal well-being.
- Analysis of high-profile incidents involving fake accounts, such as coordinated misinformation campaigns, identity thefts, and social engineering attacks.
- Quantitative and qualitative assessment of the economic, social, and psychological implications of fake accounts on individuals and communities.

2.5 User Behaviour Analysis Specific to Instagram:

- Empirical study of user behaviour patterns specific to Instagram, including posting frequency, content preferences, engagement metrics, and interaction dynamics.
- Identification of anomalies and deviations from normal behaviour that may indicate fraudulent or malicious activity, such as sudden spikes in follower count or abnormal engagement rates.
- Development of models and algorithms for detecting anomalous behaviour and distinguishing between legitimate and fake accounts based on behavioural cues.

2.6 Regulatory and Legal Frameworks for Combatting Fake Accounts:

- Review of existing regulatory frameworks and legal provisions governing the detection and prevention of fake accounts on social media platforms.
- Analysis of legal challenges and jurisdictional issues associated with combating fake accounts across different geographical regions and legal systems.
- Exploration of potential collaborations between government agencies, regulatory bodies, and technology companies to establish effective mechanisms for addressing the proliferation of fake accounts.

2.7 Ethical Considerations in Fake Account Detection and Moderation:

- Examination of ethical dilemmas and considerations inherent in the detection and moderation of fake accounts on social media platforms.
- Discussion of issues such as privacy infringement, algorithmic bias, and freedom of speech in the context of fake account detection.
- Development of ethical guidelines and best practices for balancing the need for user protection with respect for individual rights and freedoms.

Chapter: 3 **SYSTEM ANALYSIS**

3.1 User Requirements (SRS):

- > Detailed specifications gathered through stakeholder interviews, surveys, and user feedback sessions.
- > User personas representing various roles and their respective needs within the system.
- > Functional requirements delineating the desired features and interactions for each user role.
- > Non-functional requirements addressing performance, scalability, security, and usability aspects of the system.
- > Use case scenarios illustrating how users will interact with the system to achieve their goals.
- > Requirement prioritization based on business impact and user needs.
- Validation criteria to ensure that user requirements are met and validated during system testing.

3.2 Hardware Requirements:

- > Detailed hardware specifications for server infrastructure, including CPU, RAM, storage capacity, and network bandwidth.
- > Redundancy and fault-tolerance configurations to ensure high availability and data integrity.
- Scalability considerations to accommodate potential increases in user traffic and data volume.
- > Environmental requirements for hosting the server infrastructure, including power, cooling, and physical security measures.
- > Compliance with industry standards and best practices for data center management and hardware procurement.

3.3 Software Requirements:

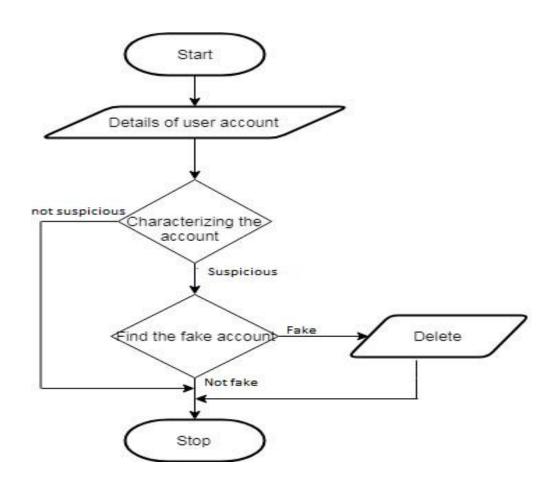

- > Selection of programming languages, frameworks, and libraries based on project requirements, team expertise, and industry best practices.
- > Database management system (DBMS) selection considering factors such as data volume, performance, and scalability requirements.
- > Integration with third-party APIs and services for implementing specific functionality, such as identity verification and fraud detection.
- > Compatibility requirements with operating systems, web browsers, and mobile devices to ensure broad accessibility.
- > Security measures, including encryption protocols, access controls, and intrusion detection/prevention systems.
- > Compliance with regulatory requirements, such as GDPR, HIPAA, and COPPA, governing data privacy and security.

Chapter:4 SYSTEM DESIGN AND SPECIFICATIONS

4.1 High Level Design (HLD)

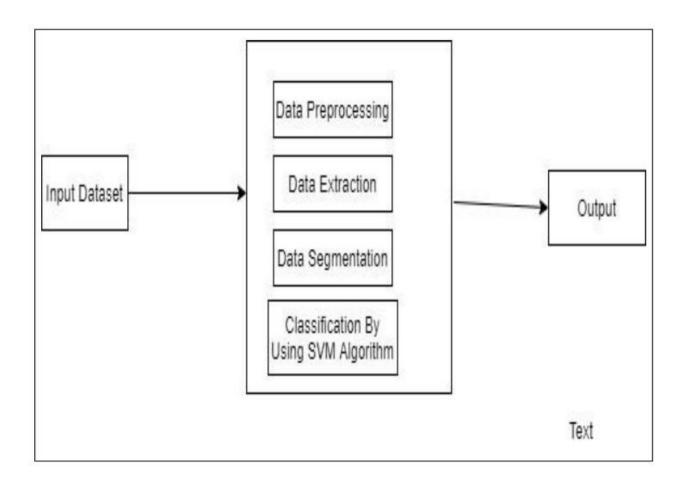

> 4.1.1 Structure Chart:

- The structure chart provides a visual representation of the system's architecture, illustrating the modular decomposition of the system into distinct components and their interrelationships.
- Each module is represented as a box, with arrows indicating the flow of data and control between modules.
- Modules may be organized hierarchically, with higher-level modules representing major system functionalities and lower-level modules representing specific tasks or sub-functions.
- The structure chart helps in understanding the overall organization of the system and facilitates communication among team members during the design and development phases.

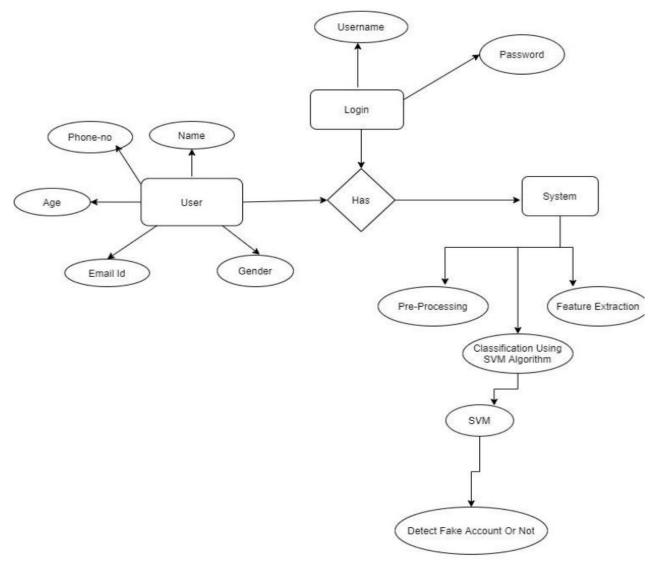

> 4.1.2 Data Flow Diagram (DFD):

- The DFD is a graphical representation of the flow of data within the system, depicting the movement of data from external sources through processes to storage and output destinations.
- It consists of four main components: external entities, processes, data stores, and data flows.
- External entities represent sources or destinations of data, such as users or external systems.
- o Processes represent transformations or operations performed on the data, such as data validation or calculation.
- O Data stores represent repositories where data is stored for later retrieval or processing.
- O Data flows represent the movement of data between components of the system, indicating the direction and nature of data flow.

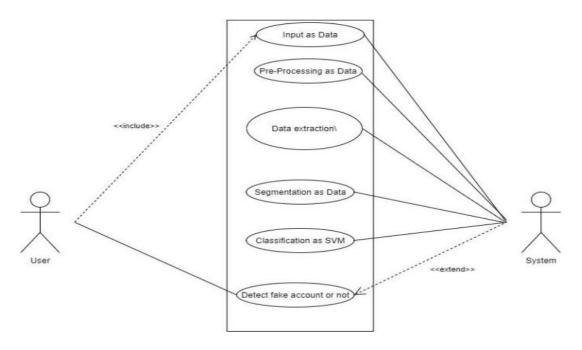

→ 4.1.3 Entity-Relationship (E-R) Diagram:

- The E-R diagram is a data modelling technique used to represent the logical structure of the system's database.
- o It consists of entities, which represent real-world objects or concepts, and relationships, which describe the associations between entities.
- Attributes are used to describe the properties or characteristics of entities, while keys are used to uniquely identify instances of entities.
- The E-R diagram provides a visual overview of the system's data schema, helping in the identification of entities, relationships, and constraints that need to be modeled in the database.

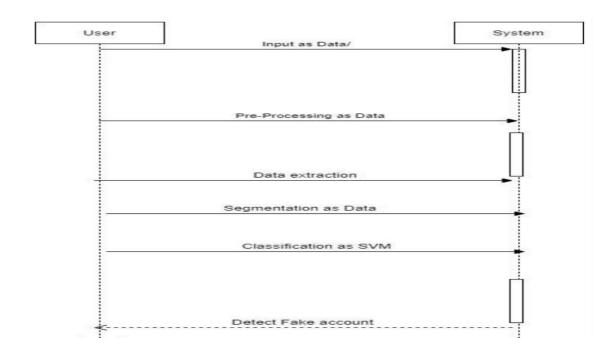

4.1.4 UML Diagrams:

Use Case Diagram: A use case diagram depicts the interactions between users (actors) and the system, illustrating the various ways in which users can interact with the system to achieve specific goals or tasks.

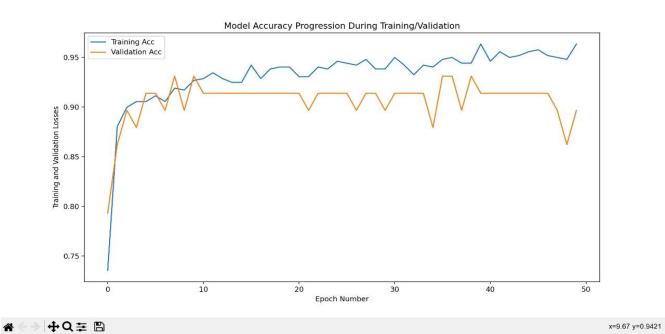

o **Class/Object Diagram:** A class/object diagram represents the static structure of the system, showing classes or objects, their attributes, and relationships between them.

Chapter:5 COADING

Importing Libraries and Dataset

import pandas as pd import matplotlib.pyplot as plt import numpy as np import seaborn as sns

import tensorflow as tf from tensorflow import keras from tensorflow.keras.layers import Dense, Activation, Dropout from tensorflow.keras.optimizers import Adam from tensorflow.keras.metrics import Accuracy

from sklearn import metrics from sklearn.preprocessing import LabelEncoder from sklearn.metrics import classification report,accuracy score,roc curve,confusion matrix

Load the training dataset instagram_df_train=pd.read_csv('insta_train.csv') instagram_df_train

Load the testing data
instagram_df_test=pd.read_csv('insta_test.csv')
instagram_df_test

instagram_df_train.head()
instagram_df_train.tail()

instagram_df_test.head()
instagram_df_test.tail()

#Performing Exploratory Data Analysis EDA

Getting dataframe info instagram df train.info()

Get the statistical summary of the dataframe instagram df train.describe()

Checking if null values exist instagram df train.isnull().sum()

```
# Get the number of unique values in the "profile pic" feature
instagram df train['profile pic'].value counts()
# Get the number of unique values in "fake" (Target column)
instagram df train['fake'].value counts()
instagram df test.info()
instagram df test.describe()
instagram df test.isnull().sum()
instagram df test['fake'].value counts()
# Perform Data Visualizations
# Visualize the data
sns.countplot(instagram df train['fake'])
plt.show()
# Visualize the private column data
sns.countplot(instagram df train['private'])
plt.show()
# Visualize the "profile pic" column data
sns.countplot(instagram df train['profile pic'])
plt.show()

Chapter:6 CONCLUSION AND LIMITATIONS

6.1 Conclusion:

The development of a robust fake Instagram ID detection system marks a significant stride towards enhancing user security and trust on the platform. By leveraging advanced algorithms and analysis techniques, coupled with user authentication and verification mechanisms, the system aims to mitigate the risks associated with fake accounts, including identity theft and the spread of misinformation. Through a multi-layered approach encompassing behavioral analysis, identity verification, and real-time monitoring, the system empowers users to identify and report suspicious activity, fostering a safer and more trustworthy online environment. Furthermore, ongoing collaboration with law enforcement agencies and continuous refinement of detection algorithms ensure the system's effectiveness in combating evolving threats posed by malicious actors.

6.2 Limitations:

Despite the system's comprehensive approach and advanced capabilities, several limitations warrant consideration:

6.2.1 False Positives/Negatives:

The detection algorithms may occasionally generate false positives, flagging legitimate accounts as suspicious, or false negatives, failing to identify certain fake accounts.

6.2.2 Resource Constraints:

The system's effectiveness may be limited by resource constraints, including computational resources for processing large volumes of data and storage capacity for maintaining historical records.

6.2.3 Scalability Challenges:

As user traffic and data volume increase, scalability challenges may arise, necessitating upgrades to server infrastructure and optimization of processing algorithms.
